

IHP Panel Mounting Instructions For Wall and Ceiling Panels

IHP160, 320S, 320, 480, 640, 900 Models

Low profile, TV style mounting bracket.

A strong & secure mount which is simple to instal.

It is the installers responsibility to use the correct fixtures and fittings to ensure a strong connection between mounting bracket and wall or ceiling

Step 1 - Contents, Remove of the mounting bracket

The heating panel is supplied with the ceiling / wall mounting bracket attached to the back of the panel together with mounting screws and plugs. To remove the bracket loosen the long locking screws then lift the bracket. **Note how the bracket clips into place.** Use alternative plugs/fixings to ensure a strong connection.

Step 2 - Marking Drills Holes

Using the mounting bracket as a template, mark 4 drill holes for the mounting plugs. NOTE - For ceiling mount, ensure that the template is parallel to the walls ie the drill holes must be the same distance to the wall. For wall mounting, a spirit level should be used to ensure the panel is level.

Step 3 - Drill the Holes, Insert the Plugs

Once the holes are drilled, insert drill plugs. Depending on the type of ceiling, the purchase of longer mounting screws may be required.

Step 4 - Fix Mounting Bracket In Place

Next position the mounting bracket in place using the mounting screws. Note: A hole for the wiring is not shown.

Step 5 - Fix the Panel to the bracket

Next clip the back bracket on the panel into the rear of the mounting bracket.

Step 6 - Lock the Panel In Place

Next, raise the front of the panel until the locking screws are above the bracket. Tighten both locking screws until the panel is locked in place. Mounting is now complete. The plastic protective film can now be removed.
